Introduction

Provides a combination of process of sensing several gas levels in the air and also the ambient temperature and humidity, thus sensing the quality of the air.

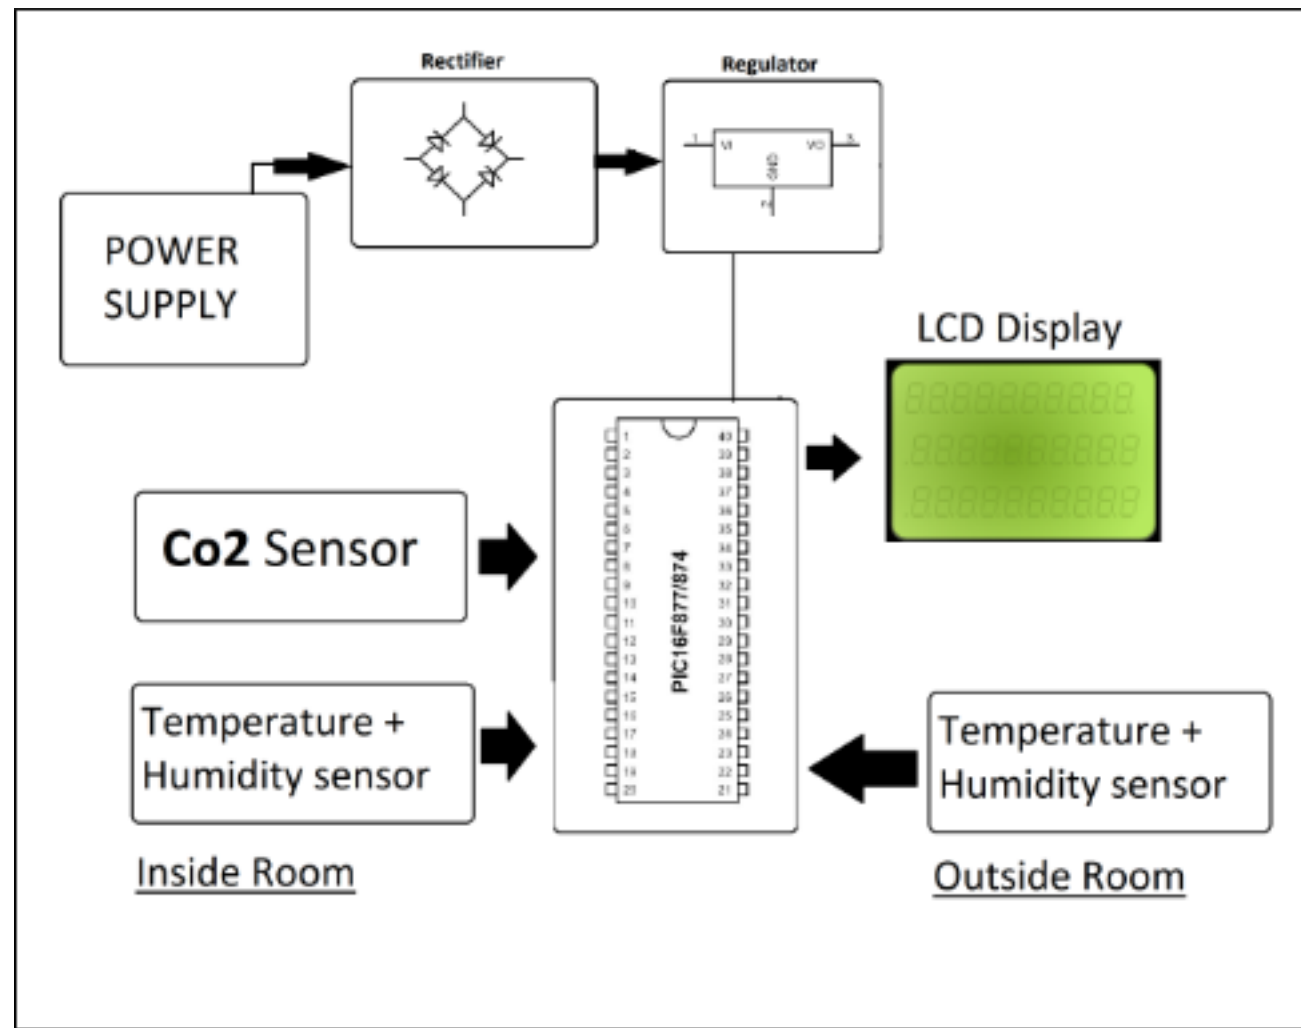

objective

To record the concentration levels of atmospheric pollutions in order to define air quality levels and establish action plans if high levels of contamination are detected

Sensor picture

Sensor picture

Inside room

CO₂ sensors are used to monitor fermentation, respiration, photosynthesis, and other carbon dioxide consuming or producing processes.

Outside room

LED display

A flat-screen device in which an array of light-emitting diodes can be selectively activated to display numerical and alphabetical information,

Pollution monitoring & controller

Air Pollution- Monitoring & Control

- Monitoring is done to keep a track on quality of air with a view to collect information & improve it.
- The best indicators are – SO_2 , smoke & suspended particles.
- These are monitored on a daily basis and the results are collected by a central agency

Project definition:

The project involves setting up IoT devices to measure air quality parameters like temperature, humidity, CO₂, O₂, PM_{2.5}, PM₁₀ and more. And to make the data publicly available for raising awareness about air quality and its impact on public health. The air quality system provides real time air quality information to the public

Design thinking

1. Project Objectives :

- i) It measures air pollution using sensors.
- ii) Sent data to the internet for analysis.
- iii) Give real time information about air quality.

2) IoT Devices designs :

- a) Sensors that detect things like dust and harmful gases in the air. The sensors like gas sensors and temperature sensors.
- b) Select a microcontroller , like Arduino or ESP32.Ensure it has enough input pins for sensors and supports the chosen communication method.

3) Data sharing Platform :

- a) The online storage where the data is kept and analysed. Using platform like AWS IoT or Google cloud IoT.

4) Integration Approach ;

- a) Depending on the chosen data sharing platform to configure IoT devices to communicate with that platform specifically.
- b) Integration might also involves setting up SDKs or libraries specific to the platform on IoT devices to streamline communication.

Over all conclusion

CONCLUSION

The proposed Wireless Air Pollution Monitoring System provides real-time information about the level of air pollution in , as well as provides alerts in cases of drastic change in quality of air. This information can then be used by the authorities to take prompt actions such as evacuating people or sending emergency response team. It uses an Air Quality Index to categorize the various levels of air pollution.
